(57) **ABSTRACT**

In a non-limiting and example embodiment, a method is provided for access parameter sharing. An access point receives a first message from a second apparatus, the first message comprising an information element indicating if access credentials may be requested for the access point. The apparatus determines, based on the first message, whether access credentials of the access point may be requested. In response to detecting that the access credentials may be requested, the apparatus transmits a request message for requesting the access credentials of the second apparatus. The access credentials are received from a third apparatus, different from the access point.
